

## **Filling system** for our firefighting backpacks

# Filling system

The **filling system** allows you to easily fill our firefighting backpacks directly on your back in the field. For filling is used water from a vehicle or, for example, our ST series water tanks with a motor pump.

The **filling system** is connected to the water source via a **D coupling**. The filling hose is terminated with a **quick-connect coupling's plug**, just like the end of the handheld pump of the firefighting backpack. The firefighting backpack is equipped with a quick-connect coupling at the end of its hose for **quick switching between filling and handheld pump**. Therefore, no assist is required for filling. The quick-connect coupling is one-way - no water will leak out of the backpack when unfastened.

The **filling hose** can be equipped with a **ball valve** with a D coupling or only a **D coupling** - this is if the water source is equipped with a ball valve with a D coupling. **The ball valve** can also be purchased separately. This is in case several firefighting backpacks are filled from one motor pump, which is not equipped with a ball valve as standard.

The **filling system** can be ordered directly with the firefighting backpack. In this case, the firefighting backpack is already **equipped with a quick-connect coupling** at the factory. If you purchase a filling system for an older firefighting backpack, you must also order a quick-connect coupling.

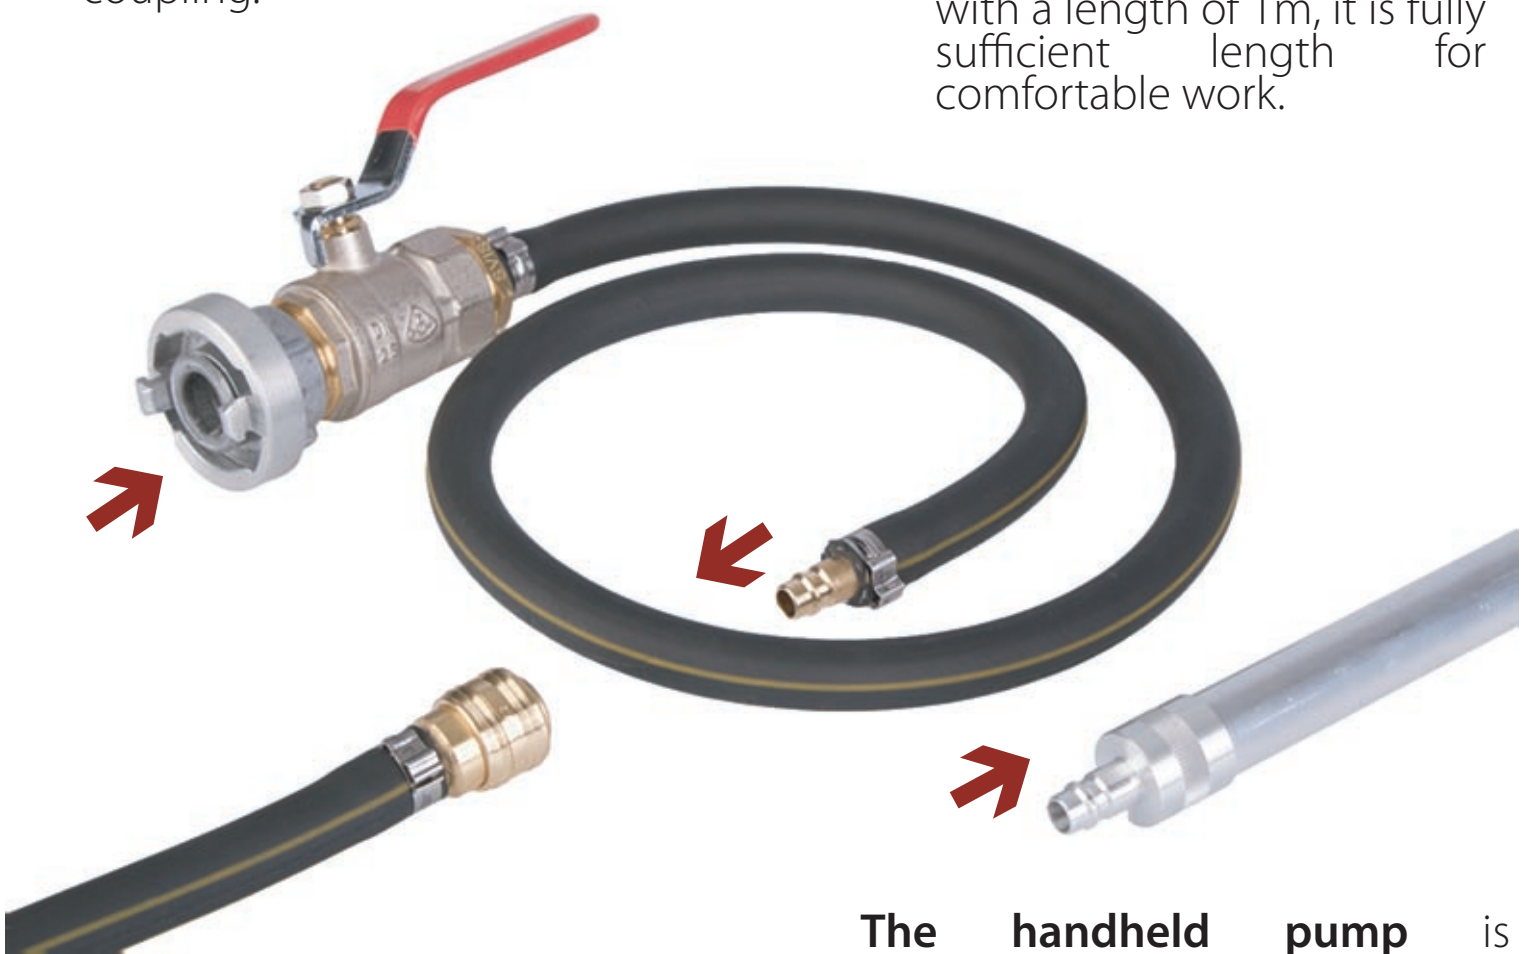

Hose length [m]	1
System connection	D25
Weight with ball valve [g]	
Weight with D coupling [g]	

Specification

# Filling system

**D coupling** for connection to a motor pump with a ball valve or with only a D coupling.

**The filling hose** is 1m long as standard. With the hose of the firefighting backpack with a length of 1m, it is fully sufficient length for comfortable work.

**The quick-connect coupling** of the firefighting backpack. The quick-connect coupling allows for quick switching between filling and handheld pump.

**The handheld pump** is terminated with a quick-connect coupling's plug. The filling system can therefore be used with an already purchased firefighting backpack without modifying.
